Single Event Effects

Proton Test Report

Test type	Single-Event Upset, Single Event Latchup
Part Reference	4B4G0846Q
Tested function	DDR3L SDRAM
Chip manufacturer	Samsung
Test Facility	PIF, Paul Scherrer Institute (PSI), Villigen, Switzerland
Test Date	May 2018
Customer	ESA ESTEC

Esa Estec Purchase Order N° 4000112477/14/NL/HB dated December 4th, 2014

1 Introduction

This report presents results of SEE proton test campaign for the Samsung DDR3L SDRAM 4B4G0846Q. 4 parts were used with 2 parts per test mode, high speed and low speed. The test campaign took place at PIF, Paul Scherrer Institute (PSI), Villigen, Switzerland in May 2018.
This test has been performed after the heavy ion test of the device which shows no SEL event with high LET (Xenon) ion. This is why SEL testing was not repeated during this proton test.

3 Device Information

Device description

4B4G0846Q, DDR3L SDRAM

Manufacturer:	Samsung
Package:	78-Ball FBGA 11 x 10 mm
Marking:	SEC 510 HYKO K4B4G0846Q EKA3R9A6C, xxxEKA3R9GDC
Date code	1510
Technology:	CMOS
Die dimensions:	7.3 x 8.6 mm

This 4Gb memory is composed of 1 die with 8 banks of 1024 rows by 65536 columns of 8 bits words.

Device and die identification

Figure 1: Package, top.

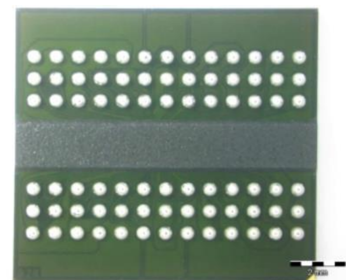

Figure 2: Package, bottom.

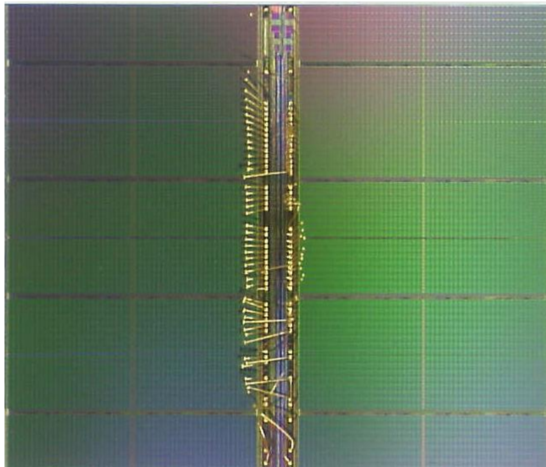

Figure 3: Die view.

Figure 4: Die marking.

4 Test Setup

Figure 5 shows the principle of the single event test system.
The test system is based on a Kintex7 FPGA (Xilinx).
The test board includes 2 slots for high speed and low speed SODDIMM daughter boards on which is mounted one DUT memory.
The test board includes the voltage/current monitoring and the latch-up management of the DUT power supplies up to 24 independent channels.
The communication between the test chamber and the controlling computer is effectively done by a 100 Mbit/s Ethernet link which safely enables high speed data transfer.
One DUT (low speed or high speed) is exposed at a time

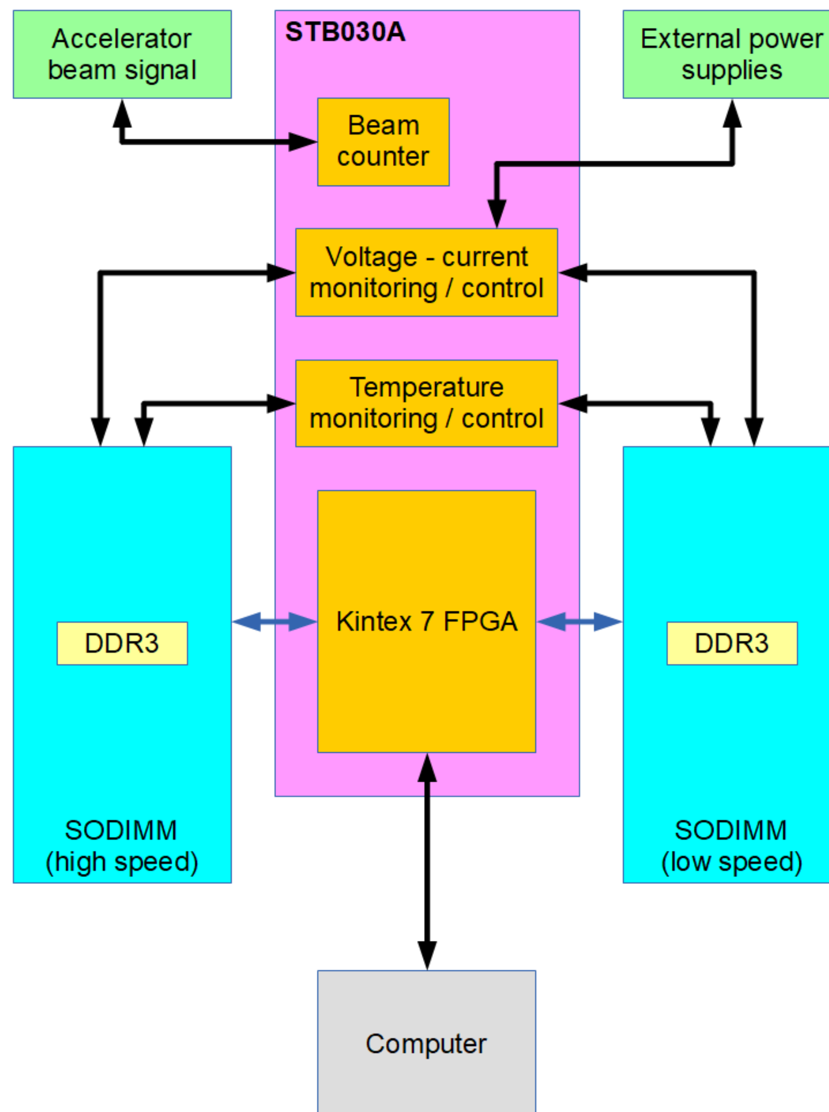

Figure 5: Hirex SEE test setup

5 Test sequence

Low speed mode is performed at a DUT clock frequency of 325MHz while high speed is performed at 700MHz.

Read/Write sequence

- Repeat cycles:
  - Write memory with 0x55 /0xAA
  - Wait 1 s
  - First Read memory (R1)
  - Second Read memory (R2)

6 PIF Test Facility

A description of PIF test facility can be found in RD-2. As shown in Figure 6, proton beam from COMET cyclotron is delivered to the experimental PIF cave with an input energy that can be varied from few MeVs up to 250 MeV. Then in PIF room, local copper degraders can be inserted into the beam to obtain the different user energies.

200 MeV input beam's energy was selected and calibrated. Figure 7 show an example of calibration together with the X and Y beam profiles.

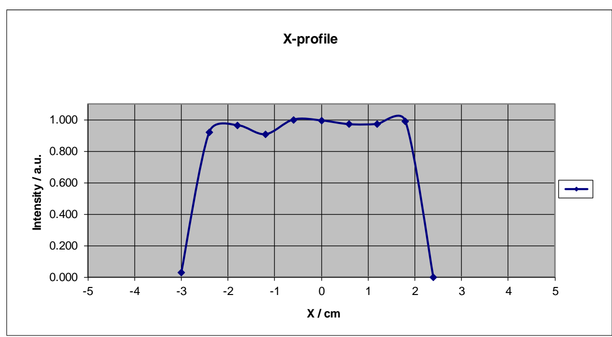

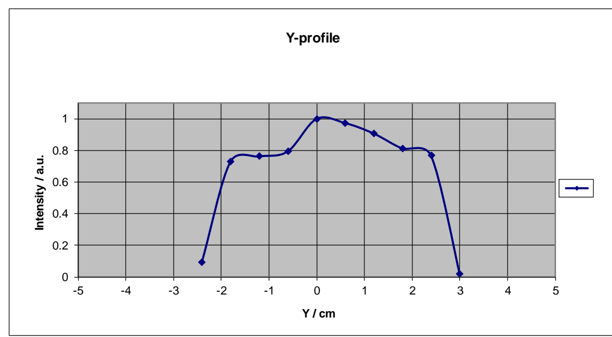

Figure 7 – 200MeV calibration results and beam profile

7 Test conditions.

SEU tests were carried out closed to Vddmin at 1.30V and room temperature.
Each memory present 8 banks of 65536 columns by 1024 rows of 8-bit words.
Each memory plane is traversed by bank, column, row which means that bank0, column0, row 0 to row 1023 is read, then bank0, column1, row 0 to row 1023, etc.
Read is done by burst which corresponds to 8 words. Each time at least 1 word is in error among the 8 words, the burst is recorded.

8 Detailed results

Runs results are summarized in Table 1.

<u>Pre-run errors</u>
Stuck bits present before exposure. They could have been created during previous runs on the DUT.
<u>R1 bit errors</u>
Number of errors detected during READ1 but not during READ2. None of these errors which represent reading errors have been detected.
<u>R1/R2 bit errors</u>
Number of errors detected during READ1 and during READ2. These errors represent SEU WRITE bit errors or SEU cells errors occurring during the time the cell is not written (as for instance during WAIT step but not only).
<u>R2 bit errors</u>
Number of errors detected during READ2 only: These errors represent reading errors which are expected to be quite few as for R1 bit errors and the SEU cells errors occurring during the time the cell is not read.
<u>Persistent bit errors</u>
Bit errors that last more than one sequence iteration. Part of these errors can persist up to the end of the run and are then counted as post-run bit errors (stuck bits). Pre-run errors have been subtracted from the persistent bit error count.
<u>Colum error</u>
Likely an error in the logic.
<u>Row errors</u>
Likely an error in the logic. Consist in a portion of row in error in a bank.
<u>SEFI</u>
These errors consist mainly in column or row errors that persist during several sequence iterations. Majority has been cured by a manual power reset.
<u>Post-run bit errors</u>
The errors are stuck bits. All affected words are single bit upset.

The corresponding cross-section are plot in Figure 8 and Figure 9 .

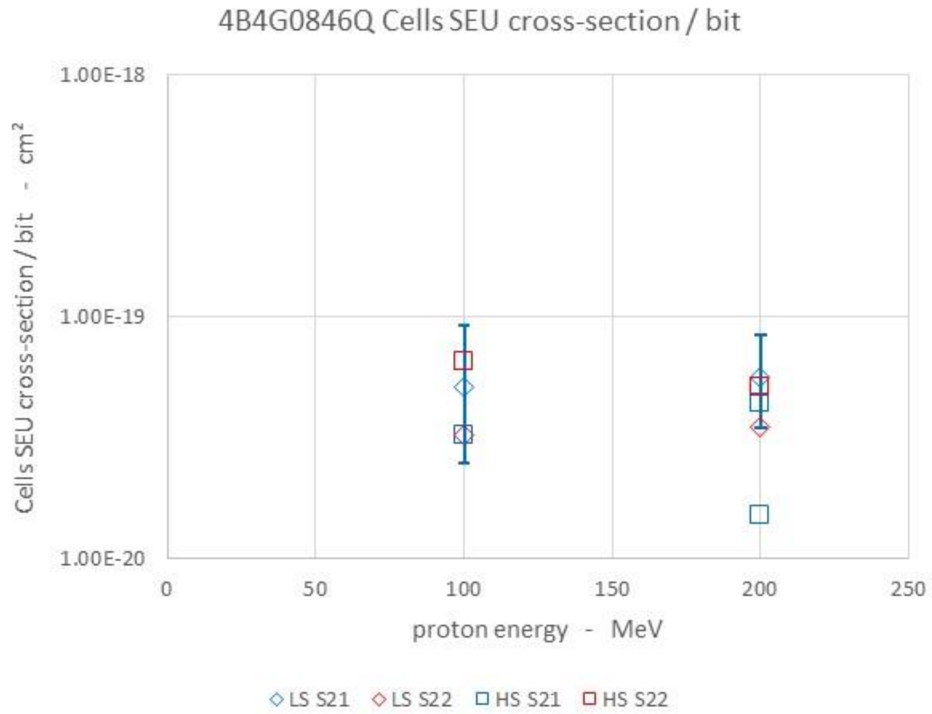

Figure 8 - Cells SEU cross-section / bit plot

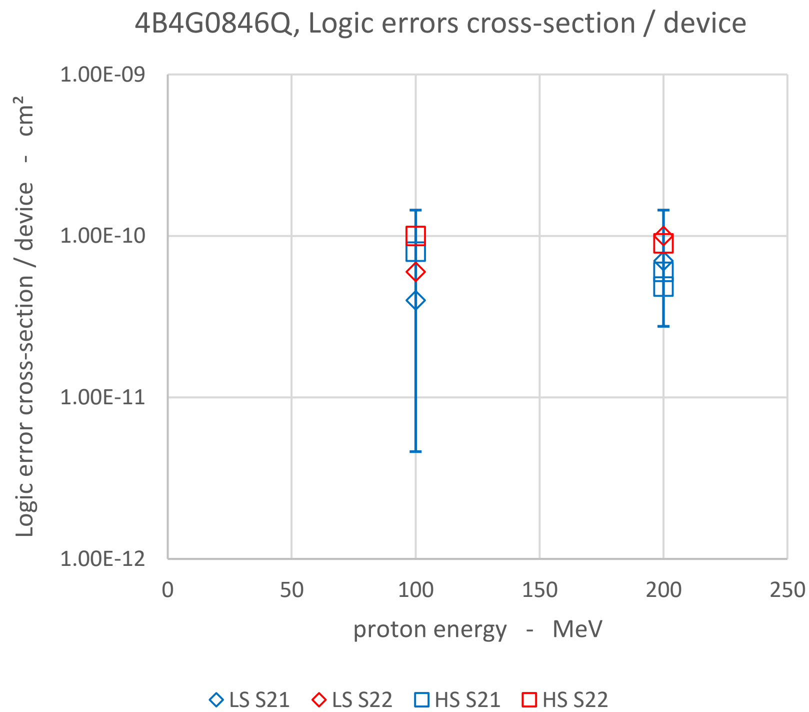

Figure 9 – Logic errors cross-section / device plot

During Run053 A large error, neither a column nor a row, has been detected and is plot in Figure 10. Same error pattern was also observed with heavy ions and only with Samsung.
All addresses in error are single bit error and error transition is always 1->0.

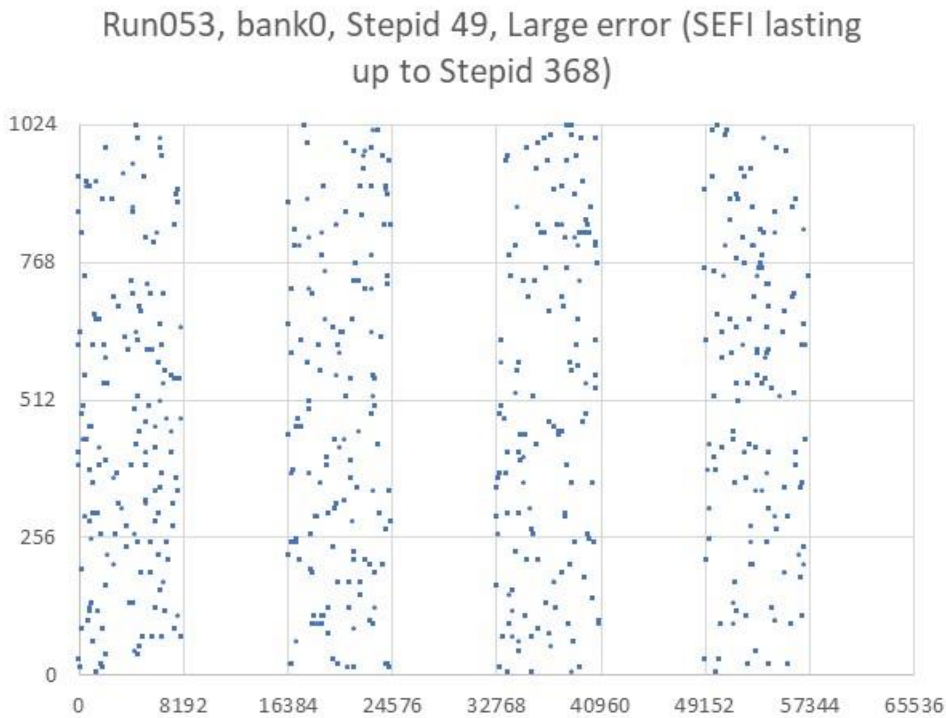

Figure 10 – run053, bank0, stepid 49, error mapping

9 Glossary

DUT: Device under test.

Fluence (of particle radiation incident on a surface): The total amount of particle radiant energy incident on a surface in a given period of time, divided by the area of the surface.
In this document, Fluence is expressed in ions per cm².

Flux: The time rate of flow of particle radiant energy incident on a surface, divided by the area of that surface.
In this document, Flux is expressed in ions per cm².s.

Single-Event Effect (SEE): Any measurable or observable change in state or performance of a microelectronic device, component, subsystem, or system (digital or analog) resulting from a single energetic particle strike.
Single-event effects include single-event upset (SEU), multiple-bit upset (MBU), multiple-cell upset (MCU), single-event functional interrupt (SEFI), single-event latch-up (SEL).

Single Event Gate Rupture (SEGR) **/ Single Event Dielectric Rupture (**SEDR**):** Destructive rupture of the gate oxide layer or dielectric layer by a single ion strike. This leads to leakage currents under bias and can be observed as stuck bits in digitals devices

Single-Event Upset (SEU)**:** A soft error caused by the transient signal induced by a single energetic particle strike.

Single-Event Transient (SET): A transient signal induced by a single energetic particle strike.

Single-Event Latch-up (SEL): An abnormal high-current state in a device caused by the passage of a single energetic particle through sensitive regions of the device structure and resulting in the loss of device functionality.
SEL may cause permanent damage to the device. If the device is not permanently damaged, power cycling of the device (off and back on) is necessary to restore normal operation.
An example of SEL in a CMOS device is when the passage of a single particle induces the creation of parasitic bipolar (p-n-p-n) shorting of power to ground.

Single-Event Functional Interrupt (SEFI): A soft error that causes the component to reset, lock-up, or otherwise malfunction in a detectable way, but does not require power cycling of the device (off and back on) to restore operability, unlike single-event latch-up (SEL), or result in permanent damage as in single-event burnout (SEB).
A SEFI is often associated with an upset in a control bit or register.

Error cross-section: the number of errors per unit fluence. For device error cross-section, the dimensions are cm² per device. For bit error cross-section, the dimensions are cm² per bit.

Tilt angle: tilt angle, rotation axis of the DUT board is perpendicular to the beam axis; roll angle, board rotation axis is parallel to the beam axis

Weibull fit: $F(x) = A\,(1-\exp\{-[(x-x_0)/W]^s\})$ with:

x = effective LET in MeV/(mg/cm^2);
$F(x)$ = SEE cross-section in cm^2;
A = limiting or plateau cross-section;
x_0 = onset parameter, such that $F(x) = 0$ for $x < x_0$;
W = width parameter;
s = a dimensionless exponent.

Error bars: error bars are computed using a confidence level of 95% and a beam flux uncertainty of +/-10% as recommended by Single Event Effects Test method and Guidelines ESA/SCC basic specification No 25100.
